
Contents

1	Cosmology: Introduction and overview	1
1.1	Preliminaries	1
1.2	Recommended Literature	1
1.3	Important dates – overview the overview of this course	2
2	Homogeneous world models	25
2.1	Introduction to cosmology	25
2.2	The kinematics of expansion	27
2.3	The dynamics of expansion	28
2.3.1	The Friedmann equation	28
2.3.2	Matter models	28
2.4	The matter contents of the current Universe	29
2.5	Equation of motion	30
3	Introduction to General Relativity	33
3.1	Special Relativity	33
3.1.1	Principle of Special Relativity	33
3.1.2	Four vectors	34
3.1.3	4-Tensors	35
3.1.4	Energy-momentum tensor	37
3.1.5	General coordinate frames (i.e. not Cartesian)	39
3.2	General Relativity	39
3.2.1	Principle of Equivalence	39
3.2.2	Equation of motion	40
3.2.3	Covariance	41
3.2.4	Covariant differentiation	42
3.3	Towards a theory of gravity	43
3.4	The field equations	44
3.4.1	Weak field considerations	44
3.4.2	What is $G_{\mu\nu}$?	45
4	Friedmann–Robertson–Walker models	49
4.1	The Robertson–Walker metric	49
4.1.1	Friedmann–Lemaître models	50
4.1.2	A Mathematica program	50
4.2	Properties of light rays; redshift	52
4.2.1	Cosmological redshift	53
4.3	Past and future expansion: the necessity of a Big Bang	53
4.4	Distances, volumes, and special cases	54
4.4.1	Distance measures	55
4.4.2	Volume elements	56
4.4.3	Special cases	57
4.5	Two problems with the FLRW models	59
4.5.1	Flatness problem	59
4.5.2	The horizon problem	60

4.5.3	Extension of the standard model: inflation	62
5	Thermal history of the Universe	65
5.1	Introduction and overview	65
5.1.1	Equilibrium in the early Universe	65
5.1.2	Characteristic temperatures	66
5.1.3	Momentum of particles as a function of time	66
5.1.4	Thermal distribution function of particles	67
5.1.5	The ultra-relativistic case	68
5.1.6	The non-relativistic case	69
5.1.7	Expansion at high temperatures	69
5.2	The freeze-out of neutrinos	70
5.2.1	The Boltzmann equation	70
5.2.2	Reaction rates and freeze-out	71
5.2.3	Neutrino freeze-out	71
5.2.4	Estimates of the chemical potential	72
5.2.5	e^+e^- annihilation	73
5.2.6	Density of relativistic particles today	74
5.3	WIMPS - Weakly Interacting Massive Particles	75
5.3.1	Relativistic particles	75
5.3.2	Non-relativistic particles	76
5.4	Big Bang Nucleosynthesis	77
5.5	From $T \sim 0.1$ MeV to $T \sim 1$ eV	81
5.6	(Re)Combination	82
6	Basics of Gravitational Lensing	91
6.1	Introduction	91
6.2	Basics of gravitational lensing	91
6.2.1	Very brief history of lensing	91
6.2.2	Deflection angle and lens equation	93
6.2.3	Effects of lensing: Multiple images	96
6.2.4	Effects of lensing: Magnification	96
6.2.5	Effects of lensing: Shape distortions	97
6.2.6	Effects of lensing: Time delay	97
6.2.7	General properties of lenses	98
6.3	(Strong) Lensing by galaxies	98
6.3.1	Mass determination	99
6.3.2	Mass models	99
6.3.3	Substructure in lens galaxies	101
6.3.4	Other properties of lens galaxies	101
7	Weak Gravitational Lensing	105
7.1	Distortion of faint galaxy images	105
7.1.1	Measurements of shapes and shear	105
7.1.2	From source to image ellipticities	106
7.1.3	Estimating the (reduced) shear	106
7.2	Problems in measuring shear, and their solutions	107
7.2.1	Major problems	107
7.2.2	Solutions	107
7.3	Magnification effects	108
7.4	Tangential and cross component of shear	108
7.4.1	The shear components	108
7.4.2	Minimum lens strength for its weak lensing detection	108
7.5	Galaxy-galaxy lensing	109
7.6	Lensing by clusters of galaxies	110
7.6.1	Introduction	110
7.6.2	The mass of galaxy clusters	111
7.6.3	Luminous arcs & multiple images	111
7.7	Mass reconstructions from weak lensing	112

7.7.1	The Kaiser–Squires inversion	113
7.7.2	Improvements and generalizations	113
7.7.3	Results	114
7.7.4	Inverse methods	117
7.7.5	Aperture mass	117
8	Structure formation in the Universe: Linear theory	119
8.1	Linear perturbation theory	119
8.1.1	Transformation to comoving coordinates	120
8.1.2	Linear perturbation equations	121
8.2	Inclusion of pressure perturbations	124
8.2.1	The Jeans equation	124
8.2.2	Perturbation in radiation-dominated phase	125
8.2.3	Matter perturbations in a radiation-dominated background	126
8.2.4	Growth of superhorizon perturbations	127
8.2.5	Coupled baryon and dark matter perturbations	128
8.3	Summary: Linear structure growth	129
8.3.1	Relation to horizon scale	129
8.3.2	Transfer function	131
8.4	The power spectrum of density fluctuations	132
8.4.1	Random fields	133
8.4.2	Correlation function and power spectrum	133
8.4.3	Gaussian random fields	134
8.4.4	Properties of Gaussian random fields	135
8.4.5	The initial power spectrum	136
8.4.6	Normalization of the power spectrum	137
8.5	Baryonic acoustic oscillations	138
8.6	The peculiar velocity field	142
8.7	Redshift-space distortions	144
9	Structure formation in the Universe: Non-linear theory	153
9.1	Structure Formation on the Computer	153
9.1.1	Basic principles of the simulations	153
9.1.2	Examples of simulations	156
9.1.3	Analysis of numerical results	158
9.2	The spherical collapse model	158
9.3	The abundance of Dark Matter halos	161
9.4	Clustering of galaxies	164
9.4.1	The spatial correlation function	164
9.4.2	Dependence on galaxy luminosity	165
9.4.3	Redshift evolution of clustering	166
9.4.4	The bias of dark matter halos	168
9.4.5	Sky projection: the angular correlation function	170
9.5	The non-linear power spectrum	171
9.5.1	The Peacock & Dodds formula	171
9.5.2	Observation of the power spectrum	173
9.6	A universal mass profile	174
9.6.1	The NFW profile	175
9.6.2	Generalization	176
9.6.3	Comparison with observations	176
9.7	The halo model	178
9.7.1	Assumptions and basic relations	179
9.7.2	Mass correlation function and power spectrum	179
9.7.3	Limits of the halo model, and the assembly bias	181
9.8	The substructure problem	182
9.8.1	Statement of the problem	182
9.8.2	Evidence for the presence of CDM substructure in galaxies	182
9.8.3	Why CDM sub-halos?	185

10 CMB anisotropies	189
10.1 Origin of the anisotropy: Overview	189
10.1.1 Primary anisotropies	189
10.1.2 From 3D to 2D	191
10.1.3 Cosmic variance	191
10.1.4 Secondary anisotropies	192
10.2 Dependence of the CMB anisotropies on the cosmological parameters	194
10.2.1 How to calculate the CMB anisotropies	196
10.3 CMB polarization	196
10.4 Observations of the CMB anisotropy	197
10.4.1 Galactic foreground	197
10.4.2 From COBE to WMAP	199
10.4.3 WMAP: Precision measurements of the CMB anisotropy	199
10.5 High-redshift supernovae and the cosmological constant	203
10.5.1 Are SN Ia standard candles?	203
10.5.2 Observing SNe Ia at high redshifts	204
10.5.3 Results	205
10.5.4 Discussion	207
10.6 Cosmological parameters	207
10.6.1 Cosmological parameters from WMAP	208
10.6.2 Cosmic harmony	210
10.7 Dark energy	211
11 Inflation	213
11.1 Basic problems with standard cosmology	213
11.2 Characteristic scales	213
11.3 The principle of inflation	214
11.3.1 The flatness problem	215
11.3.2 The horizon problem	215
11.4 Picture of inflation	216
12 Cosmic shear	221
12.1 Light propagation in an inhomogeneous Universe	221
12.2 Cosmic shear: the principle	222
12.2.1 The effective surface mass density	222
12.2.2 Limber's equation	223
12.3 Second-order cosmic shear measures	224
12.3.1 Shear correlation functions	225
12.3.2 The shear dispersion	225
12.3.3 The aperture mass	225
12.3.4 Interrelations	226
12.4 Cosmic shear and cosmology	227
12.4.1 Why cosmology from cosmic shear?	227
12.4.2 Expectations	228
12.4.3 Deriving constraints	228
12.5 E-modes, B-modes	230
12.5.1 E/B-mode decomposition of a shear field	230
12.5.2 Intrinsic alignment of source galaxies	232
12.5.3 Correlation between intrinsic ellipticity and shear	233
12.6 Predictions; ray-tracing simulations	234
12.6.1 Ray-tracing simulations: The principle	234
12.6.2 Results from ray-tracing simulations	235
12.7 Large-scale structure lensing: results	236
12.7.1 Early detections of cosmic shear	236
12.7.2 Integrity of the results	237
12.7.3 More recent cosmic shear surveys	237
12.7.4 Detection of B-modes	239
12.8 Cosmological constraints	240
12.8.1 Results from the CFHT Legacy Survey	242

12.9 Discussion, and future prospects	244
13 Galaxy formation	245
13.1 Phenomenology	245
13.2 Reionization of the Universe	246
13.2.1 Jeans mass	247
13.2.2 Baryons collapsing in dark matter halo	248
13.2.3 Cooling	248
13.2.4 History of reionization	250
13.3 The merging histories of dark matter halos	251
13.4 A toy model of galaxy formation	255
13.5 Gas physics	255
13.5.1 Cooling	255
13.5.2 Star formation	257
13.5.3 Feedback Processes	257
13.6 Formation of disk galaxies	259
13.6.1 Angular momentum of dark matter halos	259
13.6.2 Formation of disk galaxies	260
13.6.3 Disk sizes	260
13.7 Galaxy mergers	261
13.8 Hierarchical galaxy formation	263
